

## ■ INEX Systems Portal — README

Welcome to the INEX Systems Portal demo. This interface showcases both our 1.0 Light mode (classic) and our 2.0 Dark mode (next-gen) design — all in a single file with in-view routing, clickable navigation, and live theme toggle.

### ■ Theme Toggle

- The toggle button in the top-right corner switches between **1.0 Light** and **2.0 Dark** modes.
- Your last chosen theme is saved in local storage, so the portal will remember your preference.
- In 2.0 mode, you'll see a branded INEX banner and subtle UI changes to reflect a modern productized look.

### ■ Charts & Metrics

- All charts are pure inline SVG — no libraries required.
- **Sparkline Charts** show historical trends for projects and SLA performance.
- **Bar Charts** visualize ticket load by category.
- Charts automatically adapt colors to the current theme.

### ■ Navigation & Routing

- The left-hand navigation lets you preview different sections (Projects, Jobs, Inventory, SLAs, etc.).
- Routing is handled entirely in the browser using hash-based navigation (no separate HTML files).
- Each section contains example UI elements — tables, cards, forms — to demonstrate possible capabilities.

### ■ How to Deploy

1. Replace your existing **index.html** at the project root with this version.
2. Ensure **inex-logo.png** is in the same directory.
3. Push changes to your GitHub repository — the live link will update automatically.
4. Access the portal by visiting your project URL (e.g., `https://inex.cochranfilms.com``).

### ■ Tips

- This is a demo UI — no real API keys are wired up yet.
- Future versions can hook into a mock `/api`` layer for simulated data.
- The 'Schedule a Walkthrough' button can be linked to your real calendar for quick booking.
- PDF exports from dashboard views can be added for press kits or client deliverables.
